Siqi Yang

Recall: Guassianize

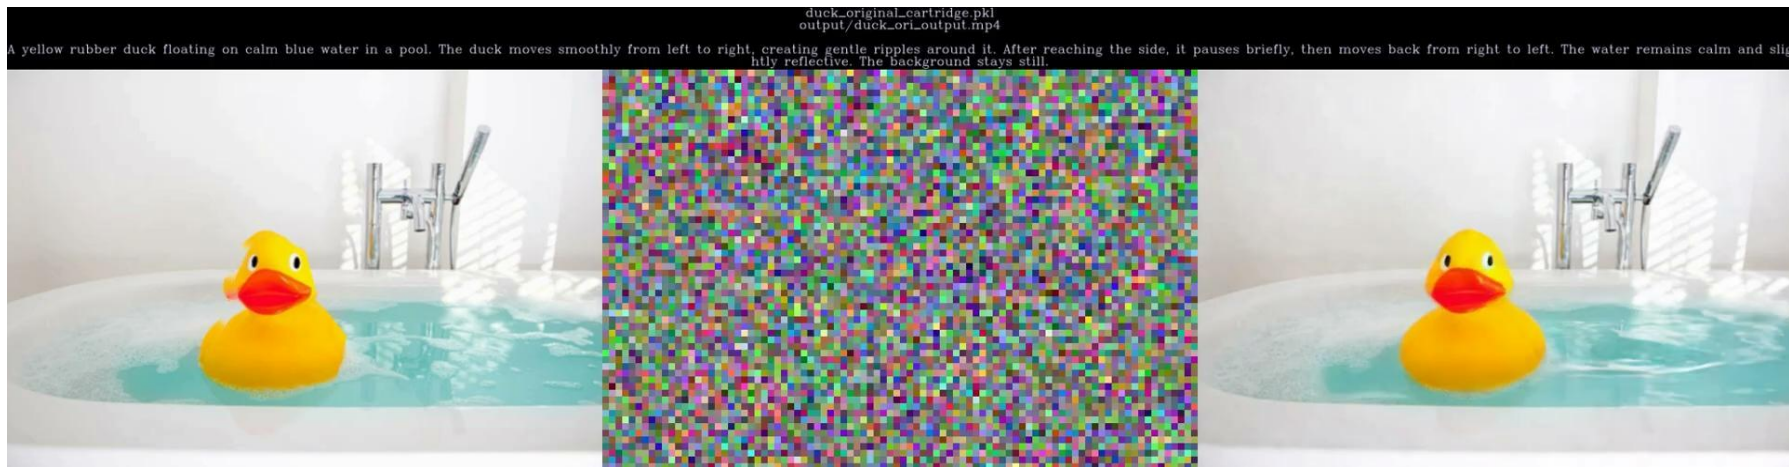

The process of regaussianization

Why should it be gaussian?

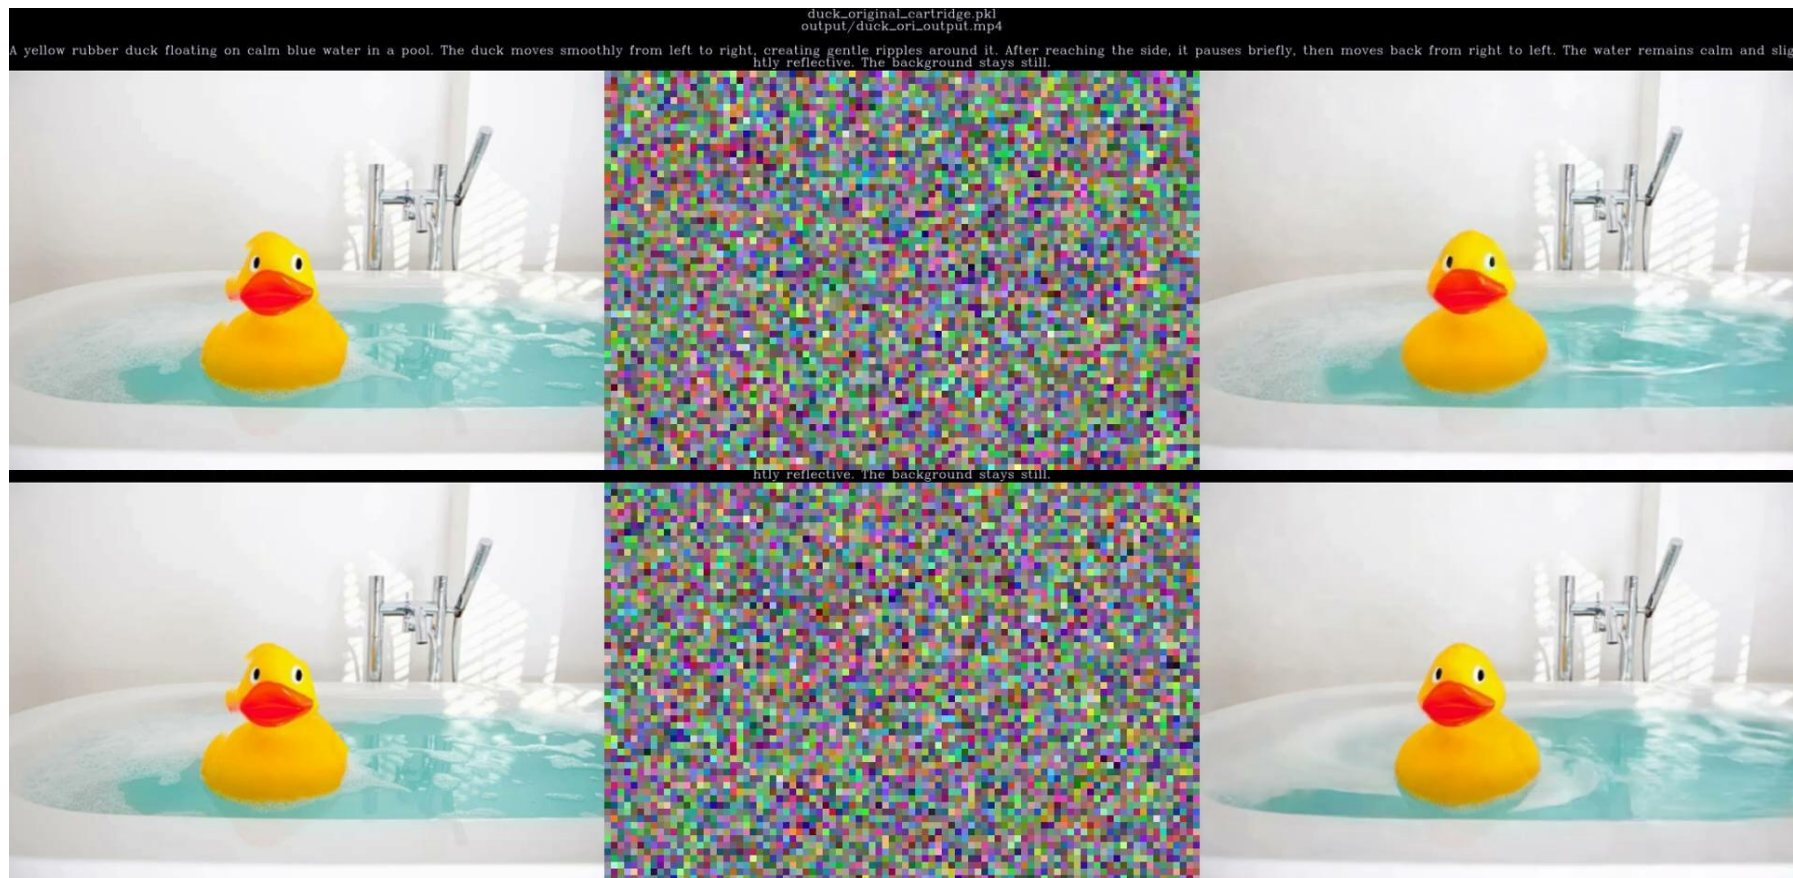

I reimplemented the warp_noise function

Original:

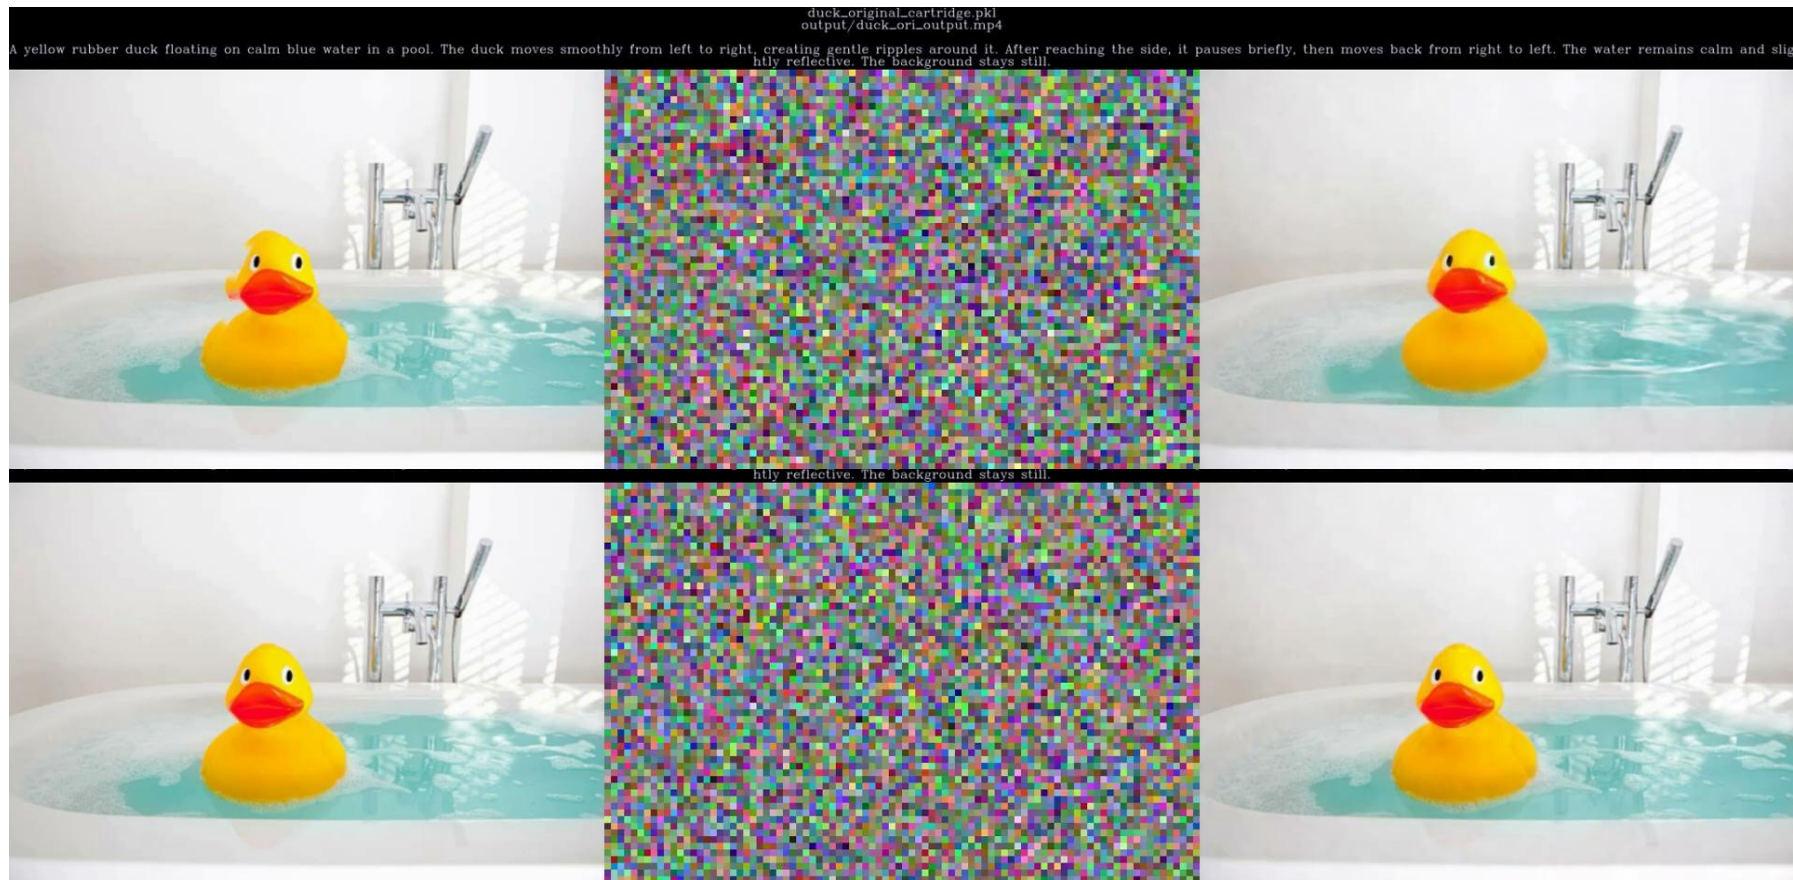

Prompt: A yellow rubber duck floating on calm blue water in a pool. The duck moves smoothly from left to right, creating gentle ripples around it. After reaching the side, it pauses briefly, then moves back from right to left. The water remains calm and slightly reflective. The background stays still.

Original vs no warp noise

No reguassion noise

No zero mean

duck_original_cartridge.pkl
output/duck_ori_output.mp4

A yellow rubber duck floating on calm blue water in a pool. The duck moves smoothly from left to right, creating gentle ripples around it. After reaching the side, it pauses briefly, then moves back from right to left. The water remains calm and slightly reflective. The background stays still.

A yellow rubber duck floating on calm blue water in a pool. The duck moves smoothly from left to right, creating gentle ripples around it. After reaching the side, it pauses briefly, then moves back from right to left. The water remains calm and slightly reflective. The background stays still.

Gaussian vs Uniform

duck_original_cartridge.pkl
output/duck_ori_output.mp4

A yellow rubber duck floating on calm blue water in a pool. The duck moves smoothly from left to right, creating gentle ripples around it. After reaching the side, it pauses briefly, then moves back from right to left. The water remains calm and slightly reflective. The background stays still.

duck_uniform_cartridge.pkl
output/duck_uniform_output.mp4

A yellow rubber duck floating on calm blue water in a pool. The duck moves smoothly from left to right, creating gentle ripples around it. After reaching the side, it pauses briefly, then moves back from right to left. The water remains calm and slightly reflective. The background stays still.

An interesting finding:

The author created a Python library to maintain reusable code.

[RP — Ryan's Python](#)

Including many things!
